

### Features

- ▶ Ultra low noise figure
- ▶ Low current consumption
- ▶ High gain broadband performance
- ▶ Single supply voltage: +3.6 V @ 30 mA
- ▶ Small die size

### Description

The CMD132 is a broadband MMIC low noise amplifier ideally suited for microwave radios and C and X-band applications where small size and low power consumption are needed. The broadband device delivers greater than 22 dB of gain with a corresponding output 1 dB compression point of +10 dBm and a noise figure of 1.4 dB. The CMD132 is a 50 ohm matched design eliminating the need for external DC blocks and RF port matching. The CMD132 amplifier is the perfect alternative to costly hybrid amplifiers.

### Specifications

#### Absolute Maximum Ratings

Parameter	Rating
Drain Voltage, Vdd	5.0 V
RF Input Power	+20 dBm
Channel Temperature, Tch	150 °C
Power Dissipation, Pdiss	367 mW
Thermal Resistance	177 °C/W
Operating Temperature	-55 to 85 °C
Storage Temperature	-55 to 150 °C

Operation of this device outside the maximum ratings may cause permanent damage.

#### Recommended Operating Conditions

Parameter	Min	Typ	Max	Units
Vdd	2.0	3.6	4.5	V
Idd		30		mA

Electrical performance is measured at specific test conditions. Electrical specifications are not guaranteed over all recommended operating conditions.

### Mechanical Information

#### Die Outline (all dimensions in microns)

#### Notes:

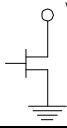

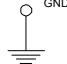

1. No connection required for unlabeled pads
2. Backside is RF and DC ground
3. Backside and bond pad metal: Gold
4. Die is 85 microns thick
5. DC bond pads are 100 microns square

1	RF in	DC blocked and 50 ohm matched	
2	Vdd	Power supply voltage Decoupling and bypass caps required	
3	RF out	DC blocked and 50 ohm matched	
Backside	Ground	Connect to RF / DC ground	

### Applications Information

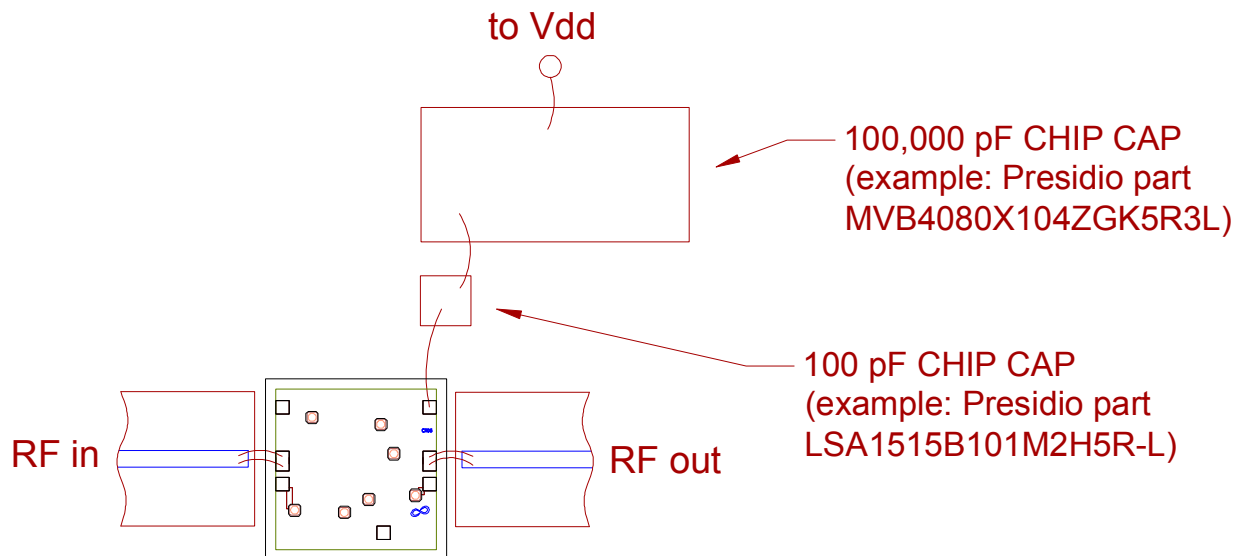

#### Assembly Guidelines

The backside of the CMD132 is RF ground. Die attach should be accomplished with electrically and thermally conductive epoxy only. Eutectic attach is not recommended. Standard assembly procedures should be followed for high frequency devices. The top surface of the semiconductor should be made planar to the adjacent RF transmission lines, and the RF decoupling capacitors placed in close proximity to the DC connections on chip.

RF connections should be made as short as possible to reduce the inductive effect of the bond wire. Use of a 0.8 mil thermosonic wedge bonding is highly recommended as the loop height will be minimized. The RF input and output require a double bond wire as shown.

The semiconductor is 85  $\mu\text{m}$  thick and should be handled by the sides of the die or with a custom collet. Do not make contact directly with the die surface as this will damage the monolithic circuitry. Handle with care.

### *Applications Information*

#### **Biasing and Operation**

The CMD132 is biased with a positive drain supply. Performance is optimized when the drain voltage is set to +3.6 V, though it may be set to a minimum of +2.0 V and a maximum of +4.5 V.

Turn ON procedure:

1. Apply drain voltage  $V_{dd}$  and set to +3.6 V

Turn OFF procedure:

1. Turn off drain voltage  $V_{dd}$

RF power can be applied at any time.
