### Description

The CMD184 is a 4.5 W wideband GaN MMIC power amplifier die which operates from 0.5 to 20 GHz. The amplifier delivers greater than 13 dB of gain with a corresponding output 1 dB compression point of +34.5 dBm and a saturated output power of +36.5 dBm. The CMD184 is a 50 ohm matched design which eliminates the need for RF port matching. The CMD184 offers full passivation for increased reliability and moisture protection.

### Applications Information

#### Assembly Guidelines

The backside of the CMD184 is RF ground. Eutectic die attach is recommended. Standard assembly procedures should be followed for high frequency devices. The top surface of the semiconductor should be made planar to the adjacent RF transmission lines, and the RF decoupling capacitors placed in close proximity to the DC connections on chip.

RF connections should be made as short as possible to reduce the inductive effect of the bond wire. Use of a 0.8 mil thermosonic wedge bonding is highly recommended as the loop height will be minimized. The RF input and output require a double bond wire as shown.

The semiconductor is 100 um thick and should be handled by the sides of the die or with a custom collet. Do not make contact directly with the die surface as this will damage the monolithic circuitry. Handle with care.

#### Assembly Diagram

**GaAs MMIC devices are susceptible to damage from Electrostatic Discharge. Proper precautions should be observed during handling, assembly and test.**

### Applications Information

#### Application Circuit

Note: Drain voltage ( $V_{dd}$ ) must be applied through a broadband bias tee or external bias network.

#### Biasing and Operation

The CMD184 is biased with a positive drain supply, positive gate supply and negative gate supply.  
Turn ON procedure:

1. Apply gate voltage  $V_{gg1}$  and set to a voltage sufficient to pinch off drain current ( $\sim -8$  V)
2. Apply drain voltage  $V_{dd}$  and set to +28 V
3. Apply gate voltage  $V_{gg2}$  and set to +10 V
4. Increase  $V_{gg1}$  (less negative) to achieve a drain current of 700 mA

Turn OFF procedure:

1. Turn off gate voltage  $V_{gg2}$
2. Turn off drain voltage  $V_{dd}$
3. Turn off gate voltage  $V_{gg1}$

RF power can be applied at any time.
