

Features

- ▶ High Power
- ▶ High linearity
- ▶ Excellent efficiency
- ▶ Small die size

Description

The CMD217 is a 8.5 W GaN MMIC power amplifier die ideally suited for Ka-band communications systems where high power and high linearity are needed. The device delivers greater than 20 dB of gain with a corresponding output 1 dB compression point of +36.7 dBm and a saturated output power of +39.3 dBm at 35% power added efficiency. The CMD217 is a 50 ohm matched design eliminating the need for external DC blocks and RF port matching. The CMD217 offers full passivation for increased reliability and moisture protection.

Notes:

1. No connection required for unlabeled pads
2. Backside is RF and DC ground
3. Backside and bond pad metal: Gold
4. Die is 100 microns thick
5. DC bond pads are 100 microns square

Assembly Guidelines

The backside of the CMD217 is RF ground. Die attach should be accomplished with electrically and thermally conductive epoxy or eutectic attach. Standard assembly procedures should be followed for high frequency devices. The top surface of the semiconductor should be made planar to the adjacent RF transmission lines, and the RF decoupling capacitors placed in close proximity to the DC connections on chip.

RF connections should be made as short as possible to reduce the inductive effect of the bond wire. Use of a 0.8 mil thermosonic wedge bonding is highly recommended as the loop height will be minimized. The RF input and output require a double bond wire as shown.

The semiconductor is 85 um thick and should be handled by the sides of the die or with a custom collet. Do not make contact directly with the die surface as this will damage the monolithic circuitry. Handle with care.

GaAs MMIC devices are susceptible to damage from Electrostatic Discharge. Proper precautions should be observed during handling, assembly and test.

Applications Information

Biasing and Operation

The CMD216 is biased with a positive drain supply and a negative gate supply. Performance is optimized when the drain voltage is set to +28.0 V and the gate voltage is set to -3.4 V.

Turn ON procedure:

1. Apply gate voltage V_{gg1} , V_{gg2} , V_{gg3} and set to -3.4 V
2. Apply drain voltage V_{dd} and set to +28 V

Turn OFF procedure:

1. Turn off drain voltage V_{dd}
2. Turn off gate voltage V_{gg1} , V_{gg2} , V_{gg3}

RF power can be applied at any time.
