

Features

- ▶ Low noise performance
- ▶ Wide bandwidth
- ▶ All positive supply voltages
- ▶ Low current consumption
- ▶ Small die size

Description

The CMD299 is a highly efficient GaAs MMIC low noise amplifier ideally suited for EW and communications systems where small size and low power consumption are needed. The device is optimized for 30 GHz and delivers greater than 17 dB of gain with a corresponding noise figure of 3.5 dB and output 1 dB compression point of +7 dBm. The CMD299 is a 50 ohm matched design which eliminates the need for external DC blocks and RF port matching. The CMD299 offers full passivation for increased reliability and moisture protection.

Notes:

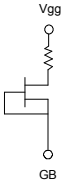

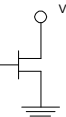

1. No connection required for unlabeled pads
2. Backside is RF and DC ground
3. Backside and bond pad metal: Gold
4. Die is 70 microns thick
5. DC bond pads (2,3,4) are 100 x 100 microns
6. RF bond pads (1,5) are 100 x 150 microns

Applications Information

Assembly Guidelines

The backside of the CMD299 is RF ground. Die attach may be accomplished with electrically and thermally conductive epoxy or eutectic bonding. Standard assembly procedures should be followed for high frequency devices. The top surface of the semiconductor should be made planar to the adjacent RF transmission lines, and the RF decoupling capacitors placed in close proximity to the DC connections on chip.

RF connections should be made as short as possible to reduce the inductive effect of the bond wire. Use of a 0.8 mil thermosonic wedge bonding is highly recommended as the loop height will be minimized. The RF input and output require a double bond wire as shown.

The semiconductor is 70 um thick and should be handled by the sides of the die or with a custom collet. Do not make contact directly with the die surface as this will damage the monolithic circuitry. Handle with care.

GaAs MMIC devices are susceptible to damage from Electrostatic Discharge. Proper precautions should be observed during handling, assembly and test.

Applications Information

Biasing and Operation

The CMD299 is biased with a positive drain supply and positive gate supply. Performance is optimized when the drain voltage is set to +3.0 V, though it may be set to a minimum of +2.0 V and a maximum of +4.0 V. The recommended gate voltage is +3.0 V.

Turn ON procedure:

1. Apply drain voltage V_{dd} and set to +3 V
2. Apply gate voltage V_{gg} and set to +3 V

Turn OFF procedure:

1. Turn off gate voltage V_{gg}
2. Turn off drain voltage V_{dd}

The preferred biasing procedure has been proven to be robust and should be used whenever possible. However, the CMD299 does allow for simultaneous biasing (applying V_{dd} and V_{gg} at the same time).

Refer to Application Note 103: Amplifier Biasing Techniques for instructions.

For either approach, RF power can be applied at any time.
